Dr. Justus Ortega, Kinesiology, shared his research journey and agenda via a powerpoint slide deck. He talked about how it evolved:

- Important to connect the needs of the campus and students to your curriculum. Look for a class that already exists that you can integrate your research and hands on opportunities for your students into. Justus developed services in the community that students perform. These hands-on opportunities are critical to student success- help student get jobs and or go to grad school.

Things/themes that resonated with others:
- driven from a real world need (like food insecurity)
- utilized and organized student skills to go to work on the solution
- developed administrative allies on campus
- partnering with lots of people on and off campus
- research, community, curriculum
- timing is important
