October was a moderately dismal month for the Humboldt County economy. The Composite Economic Index contracted by 2.8% from last month and last year. And while positive indications appear in this month’s data, current changes were mostly downward.

Leading indicators universally soured in November. Unemployment claims were up, and help wanted advertising down, indicating potential softening of the local labor market. The number of Building Permits issued also fell.

The number of homes sold within the county also contracted as per seasonal expectations. The decline was small, however, and may not be significant.

Employment continued to rise, again largely thanks to the increased hiring of state and local governments. Unemployment also increased, though. The sector is viewed as contracting from last month.

Hospitality, retail sales, and lumber manufacturing all declined, as well, at least in seasonal terms. National markets are largely performing better than the local one, and the most recent data from these indicates that some expansion may take place in the near future if local trends mimic general ones.

Overall, the data seem to fall within the broad pattern of the post-Great Recession recovery: Growth is taking place, but slowly, and with frequent minor downturns.

The Index – Leading Indicators

Leading Indicators

The Index tracks three leading indicators to get a sense of the direction that the county economy may take in the near future. The three leading indicators are (1) number of claims for unemployment insurance, (2) building permits, and (3) help wanted advertising.

Building Permits declined in last month. A drop in the already-low raw number of permits issued, combined with seasonal expectations of an increase, led the Building Permits Index to fall by 32%. The Index now stands at a value of 12.6.

Help Wanted Advertising also contracted in November. A slight decline in raw numbers was only mildly affected by seasonal adjustment. Accordingly, the Help Wanted Index fell by a relatively mild 4%. The Index’s current value is 63.7.

Unemployment Claims soared in November. The number of new applications, which has been falling since July, jumped by 460 last month. The blow was somewhat muted by seasonal adjustment, but nevertheless caused the Unemployment Claims Index to rise by 7.4%, coming to rest at a current value of 124.7.

Home Sales

The Index value of the home sales sector is based on the number of new and existing homes sold in Humboldt County each month as recorded by the Humboldt Association of Realtors.

The county housing market remained relatively stable in October, though falling slightly. The raw number of homes sold within the county dropped by about 7%. This decline was largely in line with seasonal expectations, however, and the Home Sales Index fell by only 2%, reaching a current value of 81.1. This is still well above last year’s average value of 76.9, as well as last October’s Index value of 78.0.

The cost of a home, meanwhile, dropped by $15,000 to a price of $235,000. This remains well within the normal range for the county. The average median price as of the last two years is $244,000. The mortgage rate remained constant at September’s value of 4.25%. Median and mean rents both rose, reaching $1,375 and $1,350, respectively.

Statewide, the California Association of Realtors announced that the number of homes sold in October was up about 1% on a month-to-month basis, to a seasonally adjusted and annualized 493,000. This was also an increase from October of 2010. The median price of a home was down significantly in October, to about $278,000. Case-Shiller noted that national home prices were down 3.9% for the third quarter of 2011 as compared with the third quarter of last year. Increasing sales and falling prices may indicate an increase in housing supply. It is not clear whether these developments are sustainable, however.

For a local perspective on the housing bubble, visit our Special Projects page for a study of the Humboldt County housing market. Also, visit the Humboldt Real Estate Economics Page.
Gasoline Prices

On a more hopeful note, gas prices fell again in November for the county, for the Northern California area, and for the state as a whole. The price per gallon in Eureka fell $0.04 to $3.94 last month, and the price in other areas of California declined even more. The local real price also dropped, hitting $3.19 per gallon this month.

Inflation, meanwhile, turned negative for the second time this year. Since June the Consumer Price Index has been posting very slight increases, and in October, it again decreased, this time by 0.21%. The relatively rare deflationary turn is too small to be worrisome, and market projections are for positive but low inflation for several years to come.

The Humboldt Economic Index

Retail Sales

The Index value for the retail sales sector is based on the seasonally adjusted dollar value of sales each month from a cross section of local retail businesses.

Retail Sales contracted in October for the second consecutive month. The Retail Sales Index fell somewhat more sharply than in September, down 4.8% to a current value of 136.9. This is also a drop of about 4% from last October. It remains to be seen if the coming holiday season will spur on more significant retail growth.

On a national level, the Federal Reserve’s Beige Book report noted increased economic activity in general and increases in retail sales in particular through mid-November. Findings were similar for the San Francisco-based 12th district. The latest report of the Conference Board, meanwhile, was also positive. The Consumer Confidence Index, which had declined in October, soared upwards by more than 15 percentage points in November, to stand at a current value of 56.0. The Consumer Confidence Index is based on a survey of consumer’s economic expectations. The upward swing in expectations is a hopeful indicator for the future growth of the economy.

Lumber Manufacturing

The index value of this sector is based on a combination of payroll employment and board feet of lumber production at major county lumber companies and is adjusted to account for normal seasonal variations. Lumber-based manufacturing generates about 55 percent of total county manufacturing employment.

As with the retail and hospitality sectors, Lumber Manufacturing declined in October. Production and pay role actually increased slightly, but the change was overwhelmed by an increase in seasonal expectations. The result was a 7.5% drop in the Lumber Manufacturing Index to a current value of 39.0. Even so, this represents an increase of 2.8% over this time last year, when the Index stood at a value of 38.0.

Wood Products was one of the national manufacturing industries that expanded in November, according to the Institute for Supply Management. More industries contracted than expanded, but the sector as a whole continued to grow for the 28th consecutive month. The PMI also rose, from a value in October of 50.8, and now stands at 52.7. The PMI (Producing Managers Index) is based on the number of manufacturing supply managers who expect business conditions to improve in the near future.

Electricity Consumption

The Index value of this sector is based on seasonally adjusted kilowatt-hours of electricity consumed each month in Humboldt County. Electricity consumption is a somewhat mixed or ambiguous indicator that usually correlates with economic activity. However, increases in energy efficiency and conservation reduce the sector’s index value, while not necessarily indicating a decline in economic activity. Because we collect our data for this sector quarterly, values are frequently estimated, and are revised when the quarterly data are received.

Pending the release of new quarterly data in January, this month’s Energy Consumption Index remains unchanged at an estimated value of 120.0.

Explanatory Note: We have been tracking economic activity since January 1994. The Composite Index at the beginning of this report is a weighted average of each of the six sectors described above. Each sectoral index, and the composite index, started at a value of 100 in 1994. Thus if the retail sectoral index value is currently 150, that means that (inflation-adjusted) retail sales among the firms that report data to us are 50 percent higher than in January 1994. We also seasonally adjust each sector, and the composite index, to correct for “normal” seasonal variation in the data, such as wet season vs. dry season, and so trends in the seasonally adjusted composite index provide a better indication of underlying growth and fundamental change in the economy. Each month’s report reflects the most recent data available, which is usually from the previous month. For example, the “August 2006” report reflects mostly data from July 2006. As is common, our initial report is preliminary, and as we receive final data we revise our reports accordingly.
